SUMMARY

Software Engineer 2 on Postman's Test Infrastructure and Developer Productivity team. Over the past 3+ years I've built the CI/CD, performance, and AI tooling that hundreds of engineers rely on to ship a large Electron desktop app quickly and safely. My work has spanned E2E automation, performance guardrails, coverage governance, and AI-assisted test triage. I like taking quality processes that are slow and manual and making them fast and self-serve.

RECOGNITION

> *"You have operated like a one-man army across multiple initiatives, embracing emerging AI technologies and translating them into practical, meaningful offerings for the team — and your work has been central to shifting the narrative around Test Infra, which is no longer viewed as a blocker to feature releases."*

EXPERIENCE

Postman — Software Engineer 2

Jan 2023 – Present

Test Infrastructure & Developer Productivity · India

E2E Test Platform & CI/CD

- Migrated the slow, flaky WebdriverIO suite to Playwright. WDIO had piled up wrappers and a CJS teleport framework that transpiled our ES specs, which made builds slow, and its reports needed a script just to attach logs and had no timeline view. Playwright brought native ES, much easier debugging, CDP execution (~2x faster than WDIO's ChromeDriver hops), and agent-scaffolded specs that **cut new-spec authoring ~80% (~1 story point → ~30–60 min)**.
- Designed the framework to be modular and scalable, keeping the core offerings (hydration, selective test execution, ticket creation, and performance checks) in a standalone automations package that any project can drop in through an agent.
- Built change-based selective execution so a PR runs only the specs that exercise its changed code. E2E specs don't import source directly, so the mapping is derived from coverage: each run's V8 coverage gives the compiled chunk names, which resolve through source-maps back to the executed source lines, producing a reverse source-to-spec map that selects specs when their files change. This **catches ~90% of leaked mainline bugs on the PR itself**.
- Fixed flaky Windows E2E runs caused by a Cloudflare allowlist race condition: an AWS Lambda and SQS pipeline registers each runner's dynamic IP before its run and clears it afterward.

AI & Agentic Test Tooling

- Built an MCP server and daily LLM agents that tell real product bugs apart from flaky failures, auto-fix the test-side ones, and trace each failure back to the PR that caused it with a plain-English log summary. This took most of the manual triage that used to stall PRs and releases off the team's plate.
- Designed E2E Coverage Signals, a dashboard that maps where customers actually feel pain (from GitHub, customer escalations, incident.io, and Slack) against our E2E coverage and ranks the riskiest gaps with a transparent scoring formula. A daily AI agent feeds the deterministic Node pipeline behind it, shipped as a React/Vite app on GitHub Pages. It gave leadership their first clear read on which important areas are under-tested.

Coverage & Quality Governance

- Shipped an incremental-coverage check across all backend repos as a reusable GitHub Action that tells authors whether their actual change is tested, not just where total coverage sits. Lifted company-wide unit and integration coverage from **51% to 73% in 3 months**.

Performance & Release Guardrails

- Created a release-confidence score that **holds back a tier rollout until it clears 95%**. Automated daily-release analysis and summaries took over most of the **~4–5 hr manual signoff**, a big part of how Postman now ships **daily, in under an hour**.
- Measured app warm-boot times through a Playwright → CircleCI → New Relic pipeline and turned them into release gates. Built the self-serve infra behind it so developers can trigger runs on demand across every OS, see how a change moves performance, and compare it against earlier builds.

Operations

- Moved on-call alerting from Opsgenie to incident.io, including schedules, routing, and a reusable helper package.
- Built squad- and company-level dashboards tracking incident, bug, and CUE trends, feeding the State of Quality (Looker) dashboard that gives the org a running view of reliability.
- **Cut E2E test setup time ~80% (~30s → ~6s)** by reworking test hydration (per-spec data and user setup) with parallel user creation and async cleanup, removing barrel-file imports, and caching redundant network calls.

SKILLS

AI & Agentic tooling: MCP servers, LLM agents, Cursor/Claude Automations

Test automation: Playwright, WebdriverIO, Puppeteer, Allure reporting, NYC/Istanbul, page-object design

CI/CD & build: CircleCI, GitHub Actions, Nx monorepo, Yarn v4, Selective Test Execution

Observability & data: New Relic (NRQL), Looker, AWS (Lambda, SQS, Redshift, S3), SonarQube, incident.io, Opsgenie

Performance: App relaunch benchmarking + regression gating, critical-path bundle-size gates, Lighthouse Metrics (LCP, FID, CLS)

Languages: JavaScript, C++

EDUCATION

Indian Institute of Information Technology, Allahabad — B.Tech, Information Technology

Jul 2019 – Jul 2023

CGPA 8.53
